

Item 12 of 13

Explain how cyber-attack simulations can assist in training staff in cyber security awareness. As part of your answer, include two types of simulations that could be implemented.

Cyberattack simulations can help train staff to implement security policies and practices, reducing employee vulnerability to real attacks.

Furthermore, these exercises allow companies to improve their systems and training programs and obtain metrics on the effectiveness of their security measures.

The types of simulations are:

- Red Team (Simulate adversarial attacks): This is a full-scope, stealth simulation where ethical hackers mimic a real-world threat actor. They try to infiltrate the network by any means necessary (social engineering, exploiting unpatched edge devices, physical tailgating) without warning the general IT staff.

- Blue Team (Teams respond to simulated attacks): This simulation focuses entirely on the defensive side. It tests how quickly and effectively the internal security team detects, contains, and mitigates a simulated live threat (such as an active ransomware outbreak or an unauthorized credential sweep) traversing the network.

- Purple Team (Combine red and blue teams): This is a highly collaborative, transparent simulation workshop. Instead of working in secret, the Red Team executes a specific attack technique in real-time right in front of the Blue Team. Both teams immediately inspect the logs together to see if the network infrastructure detected it, allowing them to optimize firewall rules and SIEM alerts on the spot.

- Capture the Flag (Identify and exploit vulnerabilities): While often run as a competitive game, CTF is a gamified tactical simulation. It places participants in a controlled sandbox environment where they must solve specialized security puzzles (such as cracking an encryption protocol, reverse-engineering malware, or exploiting a web vulnerability) to find a hidden piece of text (the "flag"). It simulates the exact technical hurdles an engineer faces during a real-world penetration test or incident investigation.

- Tabletop: It is a guided discussion meeting where the crisis committee sits down to resolve a hypothetical cyber disaster scenario that evolves in real time.

Simulations that could be implemented:

1. Capture the flag:

Isolated test environments can be built to conduct Capture the Flag exercises, aimed at security team personnel to analyze, find, and resolve vulnerabilities. For example, by capturing network traffic traces.

2. Tabletop:

Specifically aimed at the company's disaster response team to analyze in an isolated environment a real attack in progress that compromises information assets.
