

Communicating improvements

Item 9 of 9

To provide front line defence, ensure threats are kept to a minimum and cyber security awareness is continually updated, any review outcomes identified as improvements required, should be communicated in a timely manner.

Any new information that could help an organisation against cyber security threats, need to be integrated into policies and procedures and then communicated through training or modules to support the updates.

Imagine if you have conducted research and found that online chat messaging being used by your organisation can lead to phishing and malware attacks. You must act on this information and change the way in which the organisation uses the application, modifying the way in which they instruct staff in its use or providing a list of security risks associated with the app.

The most important factors here are:

- keeping up to date with changes, trends and new security threats
- reviewing outcomes and improvements
- communicating these in accordance with work roles and responsibilities
- conducting training and education to promote awareness and understanding
- updating policies and procedures and associated documents
- including organisational best cyber security practices across all work areas.

And remember:

More than 70% of security incidents are caused by human actions. Make your employees a strong first line of defence.

Activity: Group work – Cyber Security team project

Divide into your project team.

You are to work collaboratively as part of your cyber security team to review cyber security awareness.

The cyber security awareness program has been presented to your work team and now you must review the following new threats and make some suggestions on what should be improved for the cyber security awareness program:

- Lack of cyber security culture
- Not being able to recognise malware
- Low level understanding of cloud security threats.

Create a brief program that can be used to address and promote further cyber security best practices.

You will need to present this information to your group. Ensure that the information is:

- Clear and concise
- Professionally presented
- Uses specific and industry-related terminology relating to cyber security

Lastly, create a survey that can be used to determine if the level of awareness of staff has improved (you can survey each of the other groups on the information that you have presented).

Use the responses collected from the survey to inform senior management (your trainer/assessor) on the outcomes from the training and any potential impacts this may have on the workplace along with suggestions for improvements.

Draft an email providing these insights to senior management (your trainer/assessor), include the survey, responses and your analysis.

Your trainer/assessor will provide your group with feedback.
