

Developing a cyber security awareness program

Item 2 of 9

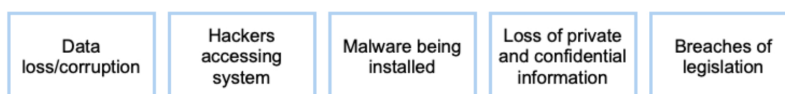

Once you have found out what the level of awareness of cyber security in a workplace, the next step would be to develop a program that could be used to promote and manage best practices. The information collected from surveys, interviews, consultations, or other relevant research conducted can ascertain the level of understanding, if there are any gaps, what the risks are of these gaps and then what can be done to educate and train employees.

You may need to firstly identify:

- responsibilities and roles for cyber security in employee work areas
- a list of the associated risks and how to deal with them
- the causes and consequences if not managed.

The above factors can then be promoted through training and education and then outlined as compliance through organisational policies and procedures.

Common risks associated with workplace cyber security can be:

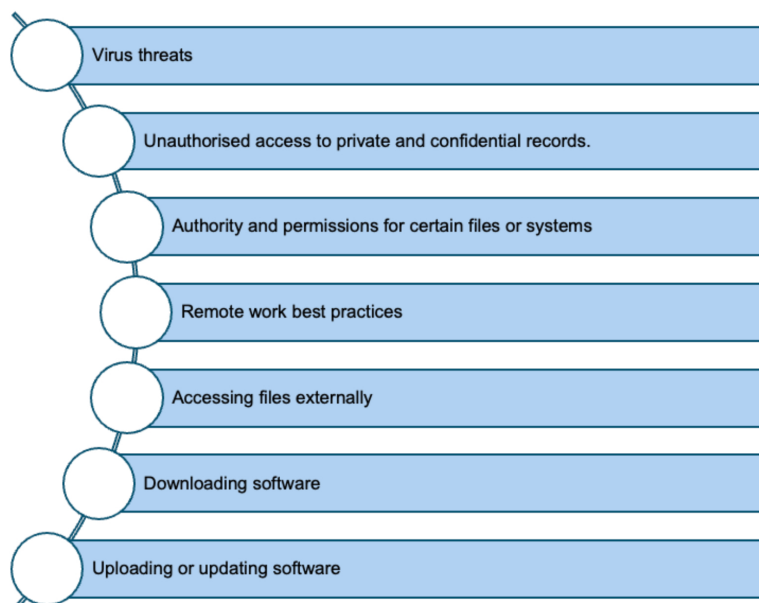

Although there will be different forms of cybersecurity threats for each work area, organisational best practices can ensure that common security risk measures can be enforced.

This could be best practices such as:

- The importance of password security
- Email, internet, and social media policies
- How to protect company data

How to identify and report cybersecurity threats.

The different forms of cybersecurity threats could cover:

A cyber security awareness program can provide employees with the information, knowledge, tools and resources to manage threats. To work, you may need to make cybersecurity training mandatory for new employees and then update and repeat on a regular basis. Providing policies and procedures can also provide guidance and support compliance.
