

Item 7 of 9

Cyber security is a constantly fast changing and evolving environment with new threats and trends impacting organisations.

Keeping abreast of what is happening, new advances or different approaches and strategies to cyber security best practices, will help to ensure that the organisation is up to date, current and aware of potential new risks.

The damage that could be caused to a business can be far reaching, often with devastating effects such as loss of reputation, data, staff and revenue.

So, what are the latest security threats and trends currently impacting organisations?

· Use of cloud services and the security issues
· Skills gaps
· Continued data breaches
· Incorporating security automation/Artificial Intelligence (AI) including deep learning and threat detection
· Lack of training and education
· No cyber incident response plans in place
· Lack of security on mobile devices used by employees
· Escalation of Denial of Service Attacks (DoSAs)
· Risks caused by using the Internet of Things (IoT) in the workplace such as unencrypted data transmission at entry points
· Phishing threats still rank highly leading to ransomware attacks, malware distribution, fraudulent payments and crypto jacking.

Activity: Watch

Watch the following webinar on insights into today's cyber-attacks (2020)

<https://www.brighttalk.com/webcast/7451/384866>

The trainer/assessor will facilitate a discussion about the outcomes from the video.
