

Suggesting improvements

Item 8 of 9

By reviewing the latest security threats and trends you can apply this information to support improvements and provide further awareness of issues impacting organisations.

Consider that some of the highest percentage of attacks are through lack of employee awareness. This could affect the ability to identify and respond appropriately to an email containing malware for example. Some improvements could be to:

- provide instructional simulated training to staff
- issue notices on phishing tactics and what to look for
- present trends and analysis figures to highlight how an organisation is impacted.

Look at the following table and brainstorm some improvements:

Cyber security skill gaps have been identified within an organisation	
Ineffective firewall controls	
A ransomware incident	
Mobile apps with known issues are still being used	

Activity: Research and Report

Your organisation has asked you to write a report that addresses cyber security trends. You can select an organisation to provide context to the research.

The report should include:

- A spreadsheet or graph that visualises the impact of cyber security threats and trends.
- Three cyber security threats and strategies for each to minimise the risk to an organisation.
- Two different Australian government sources of information on current cyber security threats.

Your report should be between 1–2 pages long and be written in clear and concise English.

Submit your report to your assessor trainer/assessor for feedback.
